

Estimating Arbitrary Measures on the Torus from Moments

Paul Catala. Joint work with M. Hockmann, S. Kunis and M. Wageringel
University of Osnabrück.

Recovering Algebraic Structures in Imaging & Signal Processing, SIAM 2022, 23.03.22

Super-resolution. Estimate a signal from coarse measurements

- Recover pointwise sources or **more complex structures**

- Ubiquitous problem in imaging and data science, e.g. fluorescence microscopy, X-ray crystallography, mixture model estimation.

⁰images from the cell image library (<http://cellimagelibrary.org/>)

■ Borel measures

$d \in \mathbb{N} \setminus \{0\}$, $\mathbb{T} \stackrel{\text{def.}}{=} \mathbb{R}/\mathbb{Z}$ Torus,

$$\mu \in \mathcal{M}(\mathbb{T}^d)$$

Singular measures μ

■ Borel measures

$d \in \mathbb{N} \setminus \{0\}$, $\mathbb{T} \stackrel{\text{def.}}{=} \mathbb{R}/\mathbb{Z}$ Torus,

$$\mu \in \mathcal{M}(\mathbb{T}^d)$$

Singular measures μ

■ Trigonometric moments

$k \in \mathbb{Z}^d$,

$$\hat{\mu}(k) \stackrel{\text{def.}}{=} \int_{\mathbb{T}^d} e^{-2i\pi \langle k, x \rangle} d\mu(x)$$

Fourier partial sum $S_n \mu$ ($n = 20$)

■ Borel measures

$d \in \mathbb{N} \setminus \{0\}$, $\mathbb{T} \stackrel{\text{def.}}{=} \mathbb{R}/\mathbb{Z}$ Torus,

$$\mu \in \mathcal{M}(\mathbb{T}^d)$$

Singular measures μ

■ Trigonometric moments

$k \in \mathbb{Z}^d$,

$$\hat{\mu}(k) \stackrel{\text{def.}}{=} \int_{\mathbb{T}^d} e^{-2i\pi \langle k, x \rangle} d\mu(x)$$

Fourier partial sum $S_n \mu$ ($n = 20$)

How "well" can we recover μ from $\{\hat{\mu}(k)\}$, $k \in \{-n, \dots, n\}^d$?

Preliminaries

Wasserstein-1 distance

- The quality of an approximation depends on the metric over $\mathcal{M}(\mathbb{T}^d)$ ¹
- Examples include f-divergences, MMD, and Wasserstein distances
- Wasserstein distances metrize the weak* topology (on compact sets), *i.e.*

$$\mu_n \rightarrow \mu \iff \mathcal{W}_p(\mu_n, \mu) \rightarrow 0$$

- Wasserstein-1 further admits the practical (dual) formulation

$$\mathcal{W}_1(\mu, \nu) = \sup_{f \in \mathcal{C}(\mathbb{T}^d), \text{Lip}(f) \leq 1} \int f d(\mu - \nu)$$

→ requires no positivity, only $\mu(\mathbb{T}^d) = \nu(\mathbb{T}^d)$

→ $\text{Lip}(f) \leq 1$ means $|f(x) - f(y)| \leq \min_{k \in \mathbb{Z}^d} \|x - y + k\|_1, \forall x, y$

¹ Mhaskar, 2019, Super-Resolution Meets Machine Learning: Approximation of Measures

Definition (Moment matrix). Given $\{\hat{\mu}(k)\}$, $k \in \{-n, \dots, n\}^d$, we define the moment matrix

$$T_n \stackrel{\text{def.}}{=} \left[\hat{\mu}(k-l) \right]_{k,l \in \{0, \dots, n\}^d}.$$

■ **Singular value decomposition**

$$T_n = \sum_{j=1}^r \sigma_j u_j^{(n)} v_j^{(n)*}$$

■ When $\mu = \sum_{j=1}^r \lambda_j \delta_{x_j}$, T_n admits the **Vandermonde decomposition**

$$T_n = A \Lambda A^*$$

where $A = \left[e^{-2i\pi \langle k, x_j \rangle} \right]_{k \in \{0, \dots, n\}^d, j \in \llbracket 1, r \rrbracket}$ and $\Lambda = \text{Diag}(\lambda)$.

Polynomial Approximations

Best Polynomial Approximation

- Assume μ is of finite total variation, $\|\mu\|_{TV} = 1$
- We make **no further assumptions**

Best Polynomial Approximation

- Assume μ is of finite total variation, $\|\mu\|_{TV} = 1$
- We make **no further assumptions**

Theorem (Worst-case bound). For every $d, n \in \mathbb{N}$, for every $\mu \in \mathcal{M}(\mathbb{T}^d)$, there exists a polynomial of best approximation in the Wasserstein-1 distance. Moreover, it holds that

$$\sup_{\mu \in \mathcal{M}} \min_{\deg(p) \leq n} \mathcal{W}_1(p, \mu) \geq \frac{1}{4(n+1)}.$$

Idea of the proof

$$\begin{aligned} \sup_{\mu} \min_p \mathcal{W}_1(p, \mu) &\geq \min_p \mathcal{W}_1(p, \delta_0) \\ &= \min_p \sup_{\text{Lip}(f) \leq 1} \|f - \check{p} * f\|_{\infty} \quad (\check{p}(x) = p(-x)) \\ &\geq \sup_{\text{Lip}(f) \leq 1} \min_p \|f - p\|_{\infty} \end{aligned}$$

- worst-case error for best polynomial approximation of Lipschitz functions
- generalize a univariate argument of **[Fisher 1977]** to the multivariate case

¹ Fisher, 1977, Best Approximation by Polynomials

Fejér approximation

- Consider the Fejér kernel F_n

$$F_n(x) \stackrel{\text{def.}}{=} \frac{1}{(n+1)^d} \prod_{i=1}^d \frac{\sin^2((n+1)\pi x_i)}{\sin^2(\pi x_i)}$$

- Consider the polynomial $p_n \stackrel{\text{def.}}{=} F_n * \mu$
 - alternatively

$$p_n(x) = \frac{1}{(n+1)^d} e_n(x)^* T_n e_n(x) = \frac{1}{(n+1)^d} \sum \sigma_j u_j^{(n)}(x) v_j^{(n)}(x)^*$$

- computed from $\hat{\mu}(k)$ using fast Fourier transforms

Fejér approximation

- Consider the Fejér kernel F_n

$$F_n(x) \stackrel{\text{def.}}{=} \frac{1}{(n+1)^d} \prod_{i=1}^d \frac{\sin^2((n+1)\pi x_i)}{\sin^2(\pi x_i)}$$

- Consider the polynomial $p_n \stackrel{\text{def.}}{=} F_n * \mu$
 - alternatively

$$p_n(x) = \frac{1}{(n+1)^d} e_n(x)^* T_n e_n(x) = \frac{1}{(n+1)^d} \sum \sigma_j u_j^{(n)}(x) v_j^{(n)}(x)^*$$

- computed from $\hat{\mu}(k)$ using fast Fourier transforms

Theorem (Weak* convergence). We have that $p_n \rightarrow \mu$. More precisely,

$$\mathcal{W}_1(p_n, \mu) \leq \frac{d \log(n+1) + 3}{\pi^2 n}$$

Jackson approximation

- Consider the Jackson kernel J_n

$$J_{2m}(x) \stackrel{\text{def.}}{=} \alpha(m) \prod_{i=1}^d \frac{\sin^4((m+1)\pi x_i)}{\sin^4(\pi x_i)}$$

- Consider the polynomial $q_n(x) \stackrel{\text{def.}}{=} J_n * \mu$

- also computed with FFT

Jackson approximation

- Consider the Jackson kernel J_n

$$J_{2m}(x) \stackrel{\text{def.}}{=} \alpha(m) \prod_{i=1}^d \frac{\sin^4((m+1)\pi x_i)}{\sin^4(\pi x_i)}$$

- Consider the polynomial $q_n(x) \stackrel{\text{def.}}{=} J_n * \mu$

- also computed with FFT

Theorem. (Weak* convergence) We have that $q_n \rightarrow \mu$. More precisely,

$$\mathcal{W}_1(q_n, \mu) \leq \frac{3}{2} \frac{d}{n+2}$$

- For the **worst-case bound**, sharpness is revealed in the univariate case

Lemma. For $\mu, \nu \in \mathcal{M}(\mathbb{T})$, we have

$$\mathcal{W}_1(\mu, \nu) = \int_{\mathbb{T}} |\mathcal{B}_1 * \mu(t) - \mathcal{B}_1 * \nu(t)| dt, \quad \text{where } \mathcal{B}_1(t) \stackrel{\text{def.}}{=} \sum_{k=1}^{\infty} \frac{\sin 2\pi kt}{\pi k} = \frac{1}{2} - t$$

- Periodic analog of the cumulative distribution formulation of \mathcal{W}_1 on \mathbb{R}
- If μ is absolutely continuous, leads to **unicity** of the best approximation
- If $\mu = \delta_0$, then $\mathcal{W}_1(p^*, \delta_0) = \frac{1}{4}(n+1)^{-1}$, matching our lower bound

- For the **worst-case bound**, sharpness is revealed in the univariate case

Lemma. For $\mu, \nu \in \mathcal{M}(\mathbb{T})$, we have

$$\mathcal{W}_1(\mu, \nu) = \int_{\mathbb{T}} |\mathcal{B}_1 * \mu(t) - \mathcal{B}_1 * \nu(t)| dt, \quad \text{where } \mathcal{B}_1(t) \stackrel{\text{def.}}{=} \sum_{k=1}^{\infty} \frac{\sin 2\pi kt}{\pi k} = \frac{1}{2} - t$$

- Periodic analog of the cumulative distribution formulation of \mathcal{W}_1 on \mathbb{R}
 - If μ is absolutely continuous, leads to **unicity** of the best approximation
 - If $\mu = \delta_0$, then $\mathcal{W}_1(p^*, \delta_0) = \frac{1}{4}(n+1)^{-1}$, matching our lower bound
- For the **Fejér approximation**

Theorem (Saturation). For every measure $\mu \in \mathcal{M}(\mathbb{T}^d)$ not being the Lebesgue measure, there exists a constant c such that

$$\mathcal{W}_1(p_n, \mu) \geq \frac{c}{n+1}$$

- For instance $d\mu/dx = 1 + \cos(2\pi x) := w(x)$ yields $\mathcal{W}_1(p_n, w) \geq (4\pi)^{-1}(n+1)^{-1}$
- However, $\mathcal{W}_1(p_n, \delta_0) \geq \frac{d}{\pi^2} \left(\frac{\log(n+2)}{n+1} + \frac{1}{n+3} \right)$

Polynomial Interpolation

- The singular value decomposition: $T_n = \sum_{j=1}^r \sigma_j u_j^{(n)} v_j^{(n)*}$ allows to define

$$p_{1,n}(x) = \frac{1}{(n+1)^d} \sum_{j=1}^r |u_j^{(n)}(x)|^2$$

→ unweighted counterpart of $p_n = F_n * \mu$

Interpolating Polynomial

- The singular value decomposition: $T_n = \sum_{j=1}^r \sigma_j u_j^{(n)} v_j^{(n)*}$ allows to define

$$p_{1,n}(x) = \frac{1}{(n+1)^d} \sum_{j=1}^r |u_j^{(n)}(x)|^2$$

→ unweighted counterpart of $p_n = F_n * \mu$

- Let $V \stackrel{\text{def.}}{=} \overline{\text{Supp } \mu}^Z$ be the Zariski closure of $\text{Supp } \mu$, and $V(\text{Ker } T_n)$ be the set of common roots of all polynomials in $\text{Ker } T_n$.

Theorem. We have $0 \leq p_{1,n} \leq 1$. If $V(\text{Ker } T_n) = V$, then $p_{1,n}(x) = 1$ iff $x \in V$.

- $V(\text{Ker } T_n) = V$ always holds for sufficiently large n if μ discrete¹ or $\mu \in \mathcal{M}_+$ ²
→ generalizes a result of [Ongie and Jacob 2016] to varieties of arbitrary dimension

¹ Kunis et al., 2016, A Multivariate Generalization of Prony's Method

² Wageringel, 2022, Truncated moment problems on positive-dimensional algebraic varieties

³ Ongie and Jacob, 2016, Off-the-grid recovery of piecewise constant images from few Fourier samples

- We assume that $\overline{\text{Supp } \mu}^Z \neq \mathbb{T}^d$

Theorem. Let $y \in \mathbb{T}^d \setminus \overline{\text{Supp } \mu}^Z$, and let g be a polynomial of max-degree m such that $g(y) \neq 0$ and g vanishes on $\text{Supp } \mu$. Then, for all $n \geq m$,

$$p_{1,n+m}(y) \leq \frac{\|g\|_{L^2}^2}{|g(y)|} \frac{m(4m+2)^d}{n+1} + \frac{dm}{n+m+1}$$

- In combination with the interpolation property, this proves **pointwise convergence to the characteristic function** of the support, with rate $O(n^{-1})$.

- If $\mu = \sum_{j=1}^r \lambda_j \delta_{x_j}$, stronger results are derived with the help of the Vandermonde decomposition of T_n

Theorem (Pointwise convergence). Let $x \neq x_j$ for all j . If $n + 1 > \frac{4d}{\min_{j \neq l} \|x_j - x_l\|_\infty}$, then

$$p_{1,n}(x) \leq \frac{1}{3(n+1)^2} \frac{\lambda_{\max}}{\lambda_{\min}} \sum \frac{1}{\|x - x_j\|_\infty^2}$$

Theorem (Weak* convergence). We have

$$\frac{p_{1,n}}{\|p_{1,n}\|_{L^1}} \rightarrow \frac{1}{r} \sum_{j=1}^r \delta_{x_j}$$

Numerical Illustrations

Numerical Illustrations
